The evolutionary modifications of organisms that are the result of natural selection are called adaptations. -

Adaptations give an organism a better chance of surviving in its environment. -

Adaptations improve the survival and reproductive success of an organism.

~~Speciation~~ Definition

# Download Free Evolution Natural Selection And Speciation Skills Answers

Evolution and speciation are two processes which bring changes to organisms. Evolution occurs in both micro and macro level. Gene mutations, gene flow, genetic drift, and natural selection aids the evolution in micro level. Speciation is the generation of two species from a pre-existing species.
