Model-driven app design is a component-focused approach to app development. Model-driven app design doesn't require code and the apps you make can be simple or very complex. Unlike canvas app development where the designer has complete control over app layout, with model-driven apps much of the layout is determined for you and largely designated by the components you add to the app.

Keep in mind that I'm not an expert on Domain-driven design so feel free to send your corrections. Domain-driven design (DDD) is an approach to software development based on two main principles: The primary focus of a software project should be the domain itself and not the technical details. Complex domain designs should be based on a model.

What is model-driven development (MDD) ? - Definition from ...

I have written a lot about model driven software development approaches from different perspectives. For example from a domain specific language design perspective, an integrated modeling approach for SOA perspective, etc. I also have tried to give you a balanced view on MDD by talking about the things to know before starting with MDD and by discussing some potential dangers of MDD.
